Water is the new oil in the Gulf

Infinite Complex is following closely the new narrative unfolding in the Gulf and it is not the Israeli-Hamas war. In the arid desert landscape, where oil has long been the economic bedrock is where **Infinite Complex** views opportunity for change. This narrative is one where waters increasing recognition as a critical and finite resource demands a reckoning. Four of the six most water scarce countries are in the Gulf. This is now what is facing every sector from agriculture to energy.

Infinite Complex makes their point with data that Saudi Arabia, which accounts for 60% of the population in the area, is now the third largest water consumer in the world. The demand for water is primarily met through massive exploitation of ground water. The result is that the Arabian Peninsula is the most stressed of the world's 37 largest aquifers. At present they rely on desalination, but for the volume they require, it is a multi-billion-dollar investment over many years. **Infinite Complex** sees the negative effects of brine dumped back into the sea resulting in the waters in the Gulf being 25% saltier than seawater elsewhere. Infinite Complex estimates that 55% of the world brine is produced by Saudi Arabia.

Infinite Complex believes it has an obligation, to use the resources of its subsidiaries, to replace the carbon and energy intensive means currently being used in the Gulf. Firstly, that means using the **AI** of **TerraView** to promote efficient irrigation within agriculture. Scaling **Infinite Water India's** production of Atmospheric Water Generation is another technology which does not require upsetting ecological and financial stability.

Infinite Complex realizes that there is another potential war in the mid-east if these water issues are not resolved.

is embarking on a path which seems to have many travelers, but where is everyone going? Most are hoping to find the elusive pot of gold at the end of the rainbow or more precisely, money. This isn't strange, as many people would like to be filthy rich and if their AI is really *intelligent*, they may end up with their goal.

Infinite Complex, whose goal is to provide ROI to investors before any other use of profit sees the path to riches would be much faster when applied to the technology of their intellectual property, products and services of which their various companies and subsidiaries thrive. However, **Infinite Complex** is not interested in another Metaverse or EV self-driving cars. **Infinite Complex** seeks to apply **artificial intelligence** for the good of all.

Infinite Complex believes that our concerns should be focused on means to cure the surmounting issues of agricultural drought, water stress, medical fronts, ecosystems, ocean and water body pollution or in other words 'do something productive'.

Infinite Complex, along with the companies within their conglomerate, is managing to tap into a large 'pot of gold' at the beginning of the AI rainbow.
