### **What is Geothermal Energy?**

It seems to **Infinite Water Inc.** that as countries look to phase out fossil fuels from their energy mix, technologies such as **geothermal energy** have received a major boost. Unlike wind and solar energy, **geothermal energy** is available 24/7 and can also be generated according to demand.

**Infinite Water Inc.** agrees with an MIT research study that found that tapping into just two percent of **geothermal energy** stored in rocks between two and six miles below the ground would provide **over 2,000 times the annual energy consumption in the US.**

**Infinite Water Inc.** realizes that **geothermal energy**, at 700 degrees Fahrenheit (375 degrees Celsius), water at these temperatures would become supercritical and carry 3-4 times more energy than regular hot water. When brought to the surface to run turbines, this would result in up to **three times more electricity generation.**

**Infinite Water Inc.,** being deeply involved in the business of water, believes that these are remarkable savings in the use of water while producing energy as well as **geothermal energy** being a renewable resource that can be harvested for human use and is an energy source that is basically limitless.

**Infinite Complex** has been working on **geothermal energy** applications for many years and is glad to see that both the private and government sectors are now tuning in to the potential. **Infinite Complex** congratulates a new bipartisan bill in the US which seeks to establish and support a framework for research and testing of supercritical geothermal technologies.
