How Short Are We On Water?

Infinite Water Inc & Infinite Complex realize water problems are not new, with reports indicating that we continually face growing water shortage issues for several reasons. If we are not fully able to meet the needs of a fast-growing world, then we face major concerns about future water availability and the looming threat of scarcity. One of the biggest concerns has been the erratic pattern of rainfall, another is the excessive extraction of groundwater. At the same time, the fast increase in population has led to a huge demand and consumption of water. World usage levels now surpass our available resources, thereby putting a massive strain on the existing supply.

Infinite Water Inc. & Infinite Complex notes erratic patterns in our weather leading to continued water shortages, calamities, or other events hindering water quality. This may well lead to major issues for citizens in the future, with water supply being restricted or completely unavailable, particularly during summers and dry months. Water rationing may also be a reality soon, along with higher water prices and potential concerns resulting from a lack of access to clean water.

Infinite Water Inc. & Infinite Complex invest in **technology** such as artificial intelligence (AI) which can help immensely. AI can help track water usage in real-time and also detect leaks swiftly. Sensors can flag unusual patterns of water flow, thereby helping find leaks and facilitating quick repairs.

TeraView Inc. an AI-based algorithms company can also analyze soil, humidity, energy and other weather data to predict and optimize irrigation systems and schedules as per the needs of each crop, thereby lowering water usage considerably.

Infinite Water Inc., Infinite Complex along with **TeraView Inc.** are helping create water from air and conserve water through intelligent allocation. People, companies and governments should pay attention to the examples set by **Infinite Water Inc., Infinite Complex** and **TeraView Inc.**
