Water, Recession Proof?

Infinite Water Inc. and Infinite Complex whose beginnings are based on water generation and water security continues to provide and monitor the escalating serious water situation in the USA. At the forefront are several US states that face significant water problems, including shortages, contamination, and conflicts over water usage. California, Arizona, Nevada, Colorado and especially Texas are frequently cited for water scarcity issues. Additionally, some states like Pennsylvania and Florida have notable tap water quality concerns.

Infinite Water Inc. and Infinite Complex believe the days of groundwater abundance are over and states like Texas are experiencing a water gold rush. New research published this week in Nature uncovered rapid and accelerating declines in underground water sources across the world, with some of the fastest and most significant collapses impacting aquifers that supply the American West. While the aquifers beneath Texas don't face the level of critical collapse that California's do, the hot, dry Southwestern state is also facing a thirsty century.

Infinite Water Inc. and Infinite Complex is convinced that water issues in states in the west and southwest are not the only states with diminishing water supplies. Concepts and remedies have fallen severely short of solving the dire water needs for many decades in many states. Even while billions of dollars are directed towards infrastructure and billions more on sacrificing our oceans with desalinization, nothing is slowing the water decline because several factors contribute to this crisis, including climate change, drought, and increased water demand.

Infinite Water Inc. and Infinite Complex is keenly aware of the commodification of water being a complex and debated issue. While water is essential for life and access to clean water is widely considered a human right, it is also treated as an economic good and is traded in various ways. **Infinite Water Inc. and Infinite Complex** believes that investment and innovation can attract smart money in technologies, potentially leading to increased supply and improved access to clean water.
