***Technology solutions to address drought***

**Infinite Water Inc. and Infinite Complex** continue to focus on drought and water scarcity as increasing problems globally, and work on technological advancements which play a crucial role in mitigating their impact. Key efforts, that are popular, in the area to enhance water efficiency and reduce loss are: Smart Water Management Systems, Leak Detection Systems, the Water Sense Program, Smart Irrigation, Drip Irrigation and Replacing Aging Infrastructure.

**Infinite Water Inc. and Infinite Complex** recognizes these efforts are necessary in alleviating water scarcity issues but they are not enough. Also needed are various types of water reuse and recycling as well as much more emphasis placed on rain water harvesting. These are key factors that have not been fully utilized, yet are very simple for non-potable reuse.

**Infinite Water Inc. and Infinite Complex** understands that each of the mentioned efforts need to be expanded, and quickly, but they are looking towards developing new water sources. Desalination has been touted beyond other methods. But Fog Harvesting Managed Aquifer Recharge and especially **Atmospheric Water Generation (AWG)** are growing fast in the public consciousness.

**Infinite Water Inc. and Infinite Complex** are leaders in the effort to provide their patented technology of **Atmospheric Water Generation** to the global community country by country and right down to house to house.
