Not Just Drought

Infinite Water Inc. and Infinite Complex constantly notice that when news or articles present a story regarding water, it usually has to do with weather related drought or more recurring stories of water main or infrastructure failings. If you look deeply at a single country, like India, a few patterns emerge. India's water challenges are often discussed as separate problems: drought. groundwater depletion. urban shortages and polluted rivers or major water sources. Too small an amount of knowledge focuses on groundwater pressures, water footprint, contamination risks, and urban water stress.

Infinite Water Inc. and Infinite Complex is aware that these observations stand out not because groundwater sits at the center of India's water system, but because India is the world's largest user of groundwater. In several regions, groundwater depletion is accompanied by contamination risks — including arsenic, nitrates, industrial pollutants, and wastewater infiltration. So, while India emerges as a technological super giant, the larger population is forced to survive retrieving water loaded with potential life-threatening illnesses.

Infinite Water Inc. and Infinite Complex own and maintain **Infinite Water India, Private Limited** as they devise, patent and manufacture AWGs under the "Make in India" water initiatives. **Infinite Water Inc. and Infinite Complex** also focus on indigenously manufacturing water treatment, purification, and management systems to support sustainable industrial growth. The key areas include local production of water purifiers, wastewater treatment infrastructure, and technologies for water conservation in industrial applications.

Infinite Water Inc. and Infinite Complex continue to find and invest in small to medium size water sector businesses as an industry pioneer of Operational Private Equity, an approach where investment professionals and operating executives work in close partnership throughout the lifecycle of an investment to improve business performance and drive long-term value creation.
